Bearings-only navigation inside the control loop — cell E1_j2, same episode as Figure A
angles-only MSC filter, 1 mrad / 60 s sensor; acquisition floor 45 min; error and 3σ are of the TARGET inertial position
batch IOD acquires at 45 min (floor 45 min)
shaded: pre-acquisition. The MSC filter is already running on bearings, but range is weakly observable and it is seeded from an analytic shell prior — so its 3σ UNDERSTATES the error here. The batch IOD overwrites the state at the gate; consistency is claimed only after it.
